Description			
Dear admins,			
I'd like to migrate what I currently host on my own VPS under http://gs-stats.leuenberger.net over to http://gs-stats.opensuse.org			
The graph shows a (daily updated) statistic of AppStream Metadata inside openSUSE Tumbleweed (such a graph makes no sense for released products, as there should not be variation during its lifetime)			
The website serves 'pure html and javascript' Special is the need for a cron job that checks if a new snapshot has been released and updates the data file every now and then (currently done every 6 hours on my server)			
Other than that, in order to be able to extract the appdata.xml.gz and produce the pages linked at the bottom of http://gs-stats.leuenberger.net , the OS used needs to have the possibility to install appstream-glib on it (preferably recent versions as in SLE12SP2, but SLE12SP1 should be able to cater for 2 out of the three links).			
Thank you very much for helping me set up this environment,			
Dominique			

History

#1 - 2016-07-29 11:04 - IonutVan

the correct link is: <http://gs-stats.leuenberger.net>

#2 - 2016-12-02 15:33 - dimstar

What's the status here?

From what I know this has all been installed on the right VM by now (the one hosting software.o.o) - but the external DNS entry is still not available.

#3 - 2017-01-18 10:58 - tampakrap

- Private changed from Yes to No

filed ticket to microfocus-IT

#4 - 2017-01-19 11:22 - dimstar

- Status changed from New to Resolved

VM setup, DNS int and ext configured. All done
