Target version:	Alpha		
Description			
Set up OBS and Mirror system to handle the new distribution			
The ISOs and ftp tree needs to be set to be publish=enabled in OBS.			
<pre><enable arch="local" repository="images"/></pre>			
There is a script somewhere on the obs backend that determines what gets pushed where. Adrian or Coolo know. It needs to be adjusted to handle the new distribution.			
On pontifex /etc/rsyncd-internal.conf needs to have modules to allow obs to push to the right locations. The publish_distro config needs to be adjusted too https://github.com/openSUSE/publish_distro			
Checklist:			
<ul style="list-style-type: none">• BSConfig.pm• publish script on obs backend• rsync module on pontifex• publish_distro on pontifex• /etc/xinetd.d/scan-updates on pontifex• enable publishing in project meta• notify ports maintainers so they do the same
