[functional][u] extend VLC test to check correct rendering
22/10/2018 12:43 pm - okurz

### Description

**Motivation**

Currently the VLC test module tests that we can correctly trigger the play of a video and that playing ends but we do not check that the video can actually be correctly rendered.

**Idea**

Could be beneficial to test the rendering of the video, e.g. either start paused at a certain timestamp or frame or configure VLC to still show the last frame after playing the video.

  - A small research that has to be done, is to figure out how to start a video at a known time mark/frame, and do a check against a needle.
