Description

Dear Admin,

I want to setup a mirror for a local network with the most important OpenSUSE Tumbleweed packages (only the latest version), with a maximum of 1TB.

The tutorial on https://en.opensuse.org/openSUSE:Mirror_infrastructure#rsync_modules

shows the rsync command for this purpose:

```
rsync -rlptH rsync.opensuse.org::opensuse-hotstuff-160gb /srv/pub/opensuse/ --delete-after -hi --stats
```

After running this command I've got the following response:

```
/
/

/This is rsync.opensuse.org, public rsync server of openSUSE.org,
//limited to 50 connections.
//
//If you run a public mirror, please get in contact so we can give you //
//access to the stage rsync server.
//You'll find conditions for access and further information at//
//http://en.opensuse.org/Mirror\_Infrastructure//
//
//Thanks!
//admin@opensuse.org//
//
//
//@ERROR: Unknown module 'opensuse-hotstuff-160gb'
```

Is it true that this module does not exist anymore?

Where could I find this module and how is there a list with all the modules somewhere that is up to date?

Is it also possible to get access to stage.opensuse.org, if it has the module?

Kind regards,

Melvin

Please see <https://progress.opensuse.org/issues/33346>

*Where could I find this module and how is there a list with all the
modules somewhere that is up to date?*

I suggest you use 'opensuse-full-really-everything' and exclude those things that you don't need.

*Is it also possible to get access to stage.opensuse.org, if it has the
module?*

If you going to be running a public mirror, you can certainly have access to stage.o.o.
