We see failed tests in LTP sometimes. But without having serial log or dmesg output, there is no way to understand what's going on. Especially if it happens only once, like: [link](https://openqa.suse.de/tests/3508220#step/cve-2017-18075/1)

**History**

### #1 - 2019-10-23 10:21 - cfconrad
- Checklist set to [ ] ec2, [ ] gce, [ ] azure

### #2 - 2019-11-04 12:42 - cfconrad
[link](https://github.com/os-autoinst/os-autoinst-distri-opensuse/pull/8824)

### #3 - 2019-11-04 12:42 - cfconrad
- Checklist set to [x] ec2

### #4 - 2019-11-04 12:42 - cfconrad
- Checklist set to [x] gce

### #5 - 2019-11-04 12:42 - cfconrad
- Checklist set to [x] azure

### #6 - 2019-11-04 12:43 - cfconrad
Test with:

```bash
for i in "https://openqa.suse.de/tests/3506472" "https://openqa.suse.de/tests/3506485" "https://openqa.suse.de/tests/3506496"; do
done
```

### #7 - 2019-11-06 13:56 - cfconrad
- Status changed from In Progress to Resolved

### #8 - 2019-11-08 14:18 - jlausuch
- Target version changed from 445 to 457

### #9 - 2020-10-23 13:41 - pcervinka
- Target version changed from 457 to QE Kernel Done
