History

#1 - 07/01/2020 11:21 pm - cboltz
- Private changed from Yes to No

#2 - 28/01/2020 01:04 pm - lrupp
- Checklist changed from [ ] Questions and answers from the community, [ ] status reports about everything, [ ] review old tickets to [ ] Questions and answers from the community, [ ] status reports about everything, [ ] review old tickets, [ ] RFC: SSH-key management via salt

SSH-key management via Salt

At the moment, we expect all users to login on the machines with their username from FreeIPA and become root via sudo. This will break access to all machines if the single FreeIPA instance is down. It's also a bit uncommon on (open)SUSE to work via sudo if you could work as root ;-) => therefor I like to request/discuss if we could add our SSH-Keys to Salt and deploy them to the machines, where the user is marked as admin.

#3 - 30/01/2020 09:36 pm - lrupp

Email setup on anna/elsa

Christian opened #61638 early in January, noting down that t-online's Email servers do not like Email sent by elsa (one of the HAProxy servers, which are used as mail relays for the machines in the internal network).

My current analysis points to a wrong 'myhostname' and reverse-DNS setup on anna and elsa.

The ticket contains my short analysis and a suggestion how to fix this. But maybe we have other Mailserver admins here with better ideas?

#4 - 05/02/2020 09:39 pm - cboltz
- File 2020-02-04-heroes-meeting.txt added
- Status changed from New to Closed
