Description

Observation

This test is redundant, as the "hardware" variation doesn't really deserve the time invested in the review (as it is prone to failures)

The tests running in the gnome_sled scenario are mostly distributed across other test suites, however the main candidate to replace it, would be we-module, so we're dropping gnome_sled in favor of we-module in this case, and increasing the ram there, as we know already that systems running gnome under 2G will end up in a unstable system (see https://bugzilla.suse.com/show_bug.cgi?id=1166955)

openQA test in scenario sle-15-SP3-Online-x86_64-gnome_sled@laptop_64bit-virtio-vga fails in system_prepare

Acceptance criteria

** AC1:** gnome_sled is unscheduled
** AC1:** we-module is running with 2GB of ram (use MACHINE=64bit-2gbram)

Reproducible

Fails since (at least) Build 42.1

Expected result

Last good: 36.5 (or more recent)

Further details

Always latest result in this scenario: latest
