Description			
User story			
<p>As a QA engineer, I need to add a user change password test during migration process, that is to change password of bernhard and create a new user before migration, check the new password still worked and switch user after migration then. After I changed the bernhard's password in base system, I need to make sure the later Authority pass with correct password, while the later modules such as first_boot, system_prepare, prepare_test_data etc., they require input different password for different users. OpenQA only holds one password and doesn't distinguish users, that's why I file this ticket.</p>			
Acceptance criteria			
<ol style="list-style-type: none">1. We can easily set new password for user in openQA and don't need touch passwords for other users.2. Do not affect existing test.			
Tasks			
<p>Store password for each users in os-autoinst, and use different password for type_password according to different users.</p>			
Further details			
<p>For example, when use type_password without parameter, it will use the \$testapi::password which doesn't distinguish user. This will make us hard to deal with password in openQA if I changed the password of bernhard in system, we have to update the openQA password with \$testapi::password= after that to match different password requirement(sometimes need login bernhard, sometimes need login root).</p> <p>I would say why type_password with parameter doesn't work for my requirement. Let use the handle_login as example, it check user by console type, then type_password, so the user and password are dealed separately, I can't simply just type_password with my new password to fix the issue.</p>
