Description We have huge complexity as execute tests on very different setups. Idea of the user story is to provide abstraction layer that allows delegate some operations without internal knowledge on how it's handled. We have done this already in bootloader_start module. Even though it's temporary implementation, it solves the issue for booting itself.	
Subtasks: action # 88786: [timeboxed:16h] Research on simplifying scheduling for handling the reboot Closed
