| <p><a href="https://confluence.suse.com/pages/viewpage.action?spaceKey=openqa&amp;title=QAM+openQA+review+guide">https://confluence.suse.com/pages/viewpage.action?spaceKey=openqa&amp;title=QAM+openQA+review+guide</a> explains the current process for openQA test review within SUSE QAM. We have already learned that they rely on some special rules which have not been foreseen like this within openQA, e.g. they see the black certificate as "tests reviewed and failures can be ignored" rather than "every job has a comment but not necessarily more than that" . We can try to improve openQA so that it features can be used in the correct way and review workflows become even easier.</p> |                                  |

### History

#### #1 - 2021-04-23 12:13 - okurz

Talked with geor. Mainly the information "openQA API what jobs were/are testing X incident/package", see [#91542](#) , is missing from the maintenance test template. But the "comments" tab on smelt includes the most recent test results and hence. Any non-passed test on the most recent comment must be seen as a stopper preventing the approval. In the worst case the corresponding test scenario is pulled from the test schedule according to process, in the better case the test is fixed within a reasonable time frame.

Other ideas and suggestions:

- geor: The template generator output should just output non-passed tests to not overwhelm the reader
- okurz: the template generator output mixes both "optional information" with "necessary status". Both should be separated because every power user otherwise ignores relevant text very soon
