Target version:			
Description			
Currently, we use libyui for running system on textmode image only for firstboot_textmode. We should create libyui image with installed libyui packages and open firewall ports (similar to gnome : https://progress.opensuse.org/issues/90368) and use it for yast2_firstboot_textmode and potentially for yast2_ncurses_textmode, if there are libyui modules that can be enabled.
