Category: New test	Estimated time: 0.00 hour
Target version:	
Difficulty:	
Description A test case for a site with scaling ready development collaboration, including automated deployment and monitoring. Ideas/examples about implementation details: <ul style="list-style-type: none">• Rancher/K3S for the Kubernetes solution• Ansible for automated deployment (actual user wouldn't use openQA for deployment)• Monitoring with Grafana• Gitlab for the collaboration service	
Acceptance Criteria <ul style="list-style-type: none">• A default installation target container as the automation target• One-command (like ansible-playbook deploy.yml) deployment once the target is available for the test to use• A development collaboration platform running• Ready to scale outside the initial container• A monitoring solution deployment for the cluster/service status (no need to configure actual alerts, but that the capability is there using a popular software)
