Description

In order to keep the vsftpd testuite running in s390x architecture in all maintenance runs, the following actions were taken :

1. Removed the scenarios of the testuite that were failing because of the [\[bug\]](#)
2. Recorded a soft-failure everytime the testuite with the excluded scenarios runs, as a reminder/warning

This is a temporary though workaround and when the issue is solved, these are the following **actions/acceptance criteria** that have to be solved in this ticket :

1. In vsftpd.pm remove the whole condition for the s390x architecture (soft-failure + the execution of run_s390x.sh), which were added in this [\[PR\]](#)
2. Remove run_s390x.sh from the data folder
